# **Lattices and Fixpoints** A Brief Introduction

**E** A tuple  $(A, \leq_A)$  is a poset (partially-ordered set) iff A is a set and  $\leq_A \subseteq A \times A$  is a partial order (i.e., a reflexive, transitive, and antisymmetric binary relation) on  $A$ .

◆ An example: Given a set  $S$ ,  $(2^S, \subseteq)$  is a poset.

**E** A tuple  $(A, \leq_A)$  is a poset (partially-ordered set) iff A is a set and  $\leq_A \subseteq A \times A$  is a partial order (i.e., a reflexive, transitive, and antisymmetric binary relation) on  $A$ .

❖ An example: Given a set  $S$ ,  $(2^S, \subseteq)$  is a poset.

**❖** Given a poset  $(A, \leq_A)$  and a set  $B \subseteq A$ ,

- an element  $a \in A$  is the greatest lower bound of B (glb/infimum/meet of B,  $\sqcap B$ ) iff
	- 1.  $\forall b \in B$ .  $a \leq_A b$  ("lower bound") and
	- 2.  $\forall a' \in A$ . ( $\forall b \in B$ .  $a' \leq_A b$ )  $\Longrightarrow a' \leq_A a$  ("greatest"),

**E** A tuple  $(A, \leq_A)$  is a poset (partially-ordered set) iff A is a set and  $\leq_A \subseteq A \times A$  is a partial order (i.e., a reflexive, transitive, and antisymmetric binary relation) on  $A$ .

❖ An example: Given a set  $S$ ,  $(2^S, \subseteq)$  is a poset.

**❖** Given a poset  $(A, \leq_A)$  and a set  $B \subseteq A$ ,

• an element  $a \in A$  is the greatest lower bound of B (glb/infimum/meet of B,  $\sqcap B$ ) iff

1.  $\forall b \in B$ .  $a \leq_A b$  ("lower bound") and

2.  $\forall a' \in A$ . ( $\forall b \in B$ .  $a' \leq_A b$ )  $\Longrightarrow a' \leq_A a$  ("greatest"),

- an element  $a \in A$  is the least upper bound of B (lub/supremum/join of B,  $\sqcup B$ ) iff
	- 1.  $\forall b \in B$ .  $b \leq_A a$  ("upper bound") and
	- 2.  $\forall a' \in A$ . ( $\forall b \in B$ .  $b \leq_A a'$ )  $\Longrightarrow a \leq_A a'$  ("least"),

**E** A tuple  $(A, \leq_A)$  is a poset (partially-ordered set) iff A is a set and  $\leq_A \subseteq A \times A$  is a partial order (i.e., a reflexive, transitive, and antisymmetric binary relation) on  $A$ .

◆ An example: Given a set S,  $(2^S, \subseteq)$  is a poset.

**❖** Given a poset  $(A, \leq_A)$  and a set  $B \subseteq A$ ,

• an element  $a \in A$  is the greatest lower bound of B (glb/infimum/meet of B,  $\sqcap B$ ) iff

1.  $\forall b \in B$ .  $a \leq_A b$  ("lower bound") and

2.  $\forall a' \in A$ . ( $\forall b \in B$ .  $a' \leq_A b$ )  $\Longrightarrow a' \leq_A a$  ("greatest"),

- an element  $a \in A$  is the least upper bound of B (lub/supremum/join of B,  $\sqcup B$ ) iff
	- 1.  $\forall b \in B$ .  $b \leq_A a$  ("upper bound") and
	- 2.  $\forall a' \in A$ . ( $\forall b \in B$ .  $b \leq_A a'$ )  $\Longrightarrow a \leq_A a'$  ("least"),

**An example:** For  $(2^{\{a,b,c\}}, \subseteq)$ ,  $\Box{\{\emptyset, \{a\}, \{b\}\}} = \{a, b\}$ , and  $\{a\} \Box \{b, c\} = \emptyset$ .

◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.

- ◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.
	- $\perp_A = \square A$  and  $\top_A = \square A$  are the least and greatest elements of a complete lattice, respectively.

- ◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.
	- $\perp_A = \square A$  and  $\top_A = \square A$  are the least and greatest elements of a complete lattice, respectively.
- **❖ Examples:** 
	- $(2^{\{a,b,c\}}, \subseteq)$  is a complete lattice,  $\sqcap$  corresponds to  $\cap$ ,  $\sqcup$  to  $\cup$ ,  $\perp$  to  $\emptyset$ , and  $\top$  to  ${a, b, c}.$

- ◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.
	- $\perp_A = \square A$  and  $\top_A = \square A$  are the least and greatest elements of a complete lattice, respectively.
- **❖ Examples:** 
	- $(2^{\{a,b,c\}}, \subseteq)$  is a complete lattice,  $\sqcap$  corresponds to  $\cap$ ,  $\sqcup$  to  $\cup$ ,  $\perp$  to  $\emptyset$ , and  $\top$  to  ${a, b, c}.$
	- (N,  $\leq$ ) is a lattice with  $\sqcup$  being  $max$  and  $\sqcap$  being  $min$ , but not a complete lattice since ⊔N does not exist in N.

- ◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.
	- $\perp_A = \square A$  and  $\top_A = \square A$  are the least and greatest elements of a complete lattice, respectively.
- **❖ Examples:** 
	- $(2^{\{a,b,c\}}, \subseteq)$  is a complete lattice,  $\sqcap$  corresponds to  $\cap$ ,  $\sqcup$  to  $\cup$ ,  $\perp$  to  $\emptyset$ , and  $\top$  to  ${a, b, c}.$
	- ( $\mathbb{N}, \leq$ ) is a lattice with  $\sqcup$  being  $max$  and  $\sqcap$  being  $min$ , but not a complete lattice since ⊔N does not exist in N.
	- $(N_\infty, \leq)$ , where  $N_\infty = N \cup \{\infty\}$  and  $\forall n \in \mathbb{N}$ .  $n \leq \infty$ , is a complete lattice.

- ◆ A poset  $(A, \leq_A)$  is a complete lattice iff each subset B of A has a lub as well as a glb in A.
	- $\perp_A = \square A$  and  $\top_A = \square A$  are the least and greatest elements of a complete lattice, respectively.
- **❖ Examples:** 
	- $(2^{\{a,b,c\}}, \subseteq)$  is a complete lattice,  $\sqcap$  corresponds to  $\cap$ ,  $\sqcup$  to  $\cup$ ,  $\perp$  to  $\emptyset$ , and  $\top$  to  $\{a, b, c\}.$
	- (N,  $\leq$ ) is a lattice with  $\sqcup$  being  $max$  and  $\sqcap$  being  $min$ , but not a complete lattice since ⊔N does not exist in N.
	- $(N_\infty, \leq)$ , where  $N_\infty = N \cup \{\infty\}$  and  $\forall n \in \mathbb{N}$ .  $n \leq \infty$ , is a complete lattice.

**V** Given a poset  $(A, \leq_A)$ , a set  $B \subseteq A$  is a chain iff  $\forall b, b' \in B$ .  $b \leq_A b' \lor b' \leq_A b$ .

• E.g.,  $\{\emptyset, \{a\}, \{a, b\}, \{a, b, c\}\}\$ is a chain wrt.  $(2^{\{a, b, c\}}, \subseteq)$ .

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

An element  $a \in A$  is a fixpoint of a function  $f : A \longrightarrow A$  iff  $f(a) = a$ .

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

An element  $a \in A$  is a fixpoint of a function  $f : A \longrightarrow A$  iff  $f(a) = a$ .

❖ An example: Consider the function  $f : \mathbb{N}_{\infty} \longrightarrow \mathbb{N}_{\infty}$  defined such that  $\forall n \in \mathbb{N}$ .  $f(n) = 0$ and  $f(\infty)=\infty$ .

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

An element  $a \in A$  is a fixpoint of a function  $f : A \longrightarrow A$  iff  $f(a) = a$ .

❖ An example: Consider the function  $f : \mathbb{N}_{\infty} \longrightarrow \mathbb{N}_{\infty}$  defined such that  $\forall n \in \mathbb{N}$ .  $f(n) = 0$ and  $f(\infty)=\infty$ .

● f is monotonic since (1)  $\forall n_1, n_2 \in \mathbb{N}$ .  $f(n_1) = 0 \leq 0 = f(n_2)$  and (2)  $\forall n \in \mathbb{N}$ .  $f(n) = 0 \leq \infty = f(\infty)$ .

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

An element  $a \in A$  is a fixpoint of a function  $f : A \longrightarrow A$  iff  $f(a) = a$ .

❖ An example: Consider the function  $f : \mathbb{N}_{\infty} \longrightarrow \mathbb{N}_{\infty}$  defined such that  $\forall n \in \mathbb{N}$ .  $f(n) = 0$ and  $f(\infty)=\infty$ .

- f is monotonic since (1)  $\forall n_1, n_2 \in \mathbb{N}$ .  $f(n_1) = 0 \leq 0 = f(n_2)$  and (2)  $\forall n \in \mathbb{N}$ .  $f(n) = 0 \leq \infty = f(\infty)$ .
- f is not  $\sqcup$ -continuous since  $\mathbb N$  is a chain and  $f(\sqcup \mathbb N)=f(\infty)=\infty$ , but  $\Box\{f(n) \mid n \in \mathbb{N}\} = \Box\{0\} = 0.$

 $\clubsuit$  Let  $(A,\leq_A)$  and  $(B,\leq_B)$  be lattices.

◆ A function  $f : A \longrightarrow B$  is monotonic iff  $\forall a, a' \in A$ .  $a \leq_A a' \Longrightarrow f(a) \leq_B f(a')$ .

❖ A function  $f : A \longrightarrow B$  is  $\sqcup$ -continuous iff for every chain  $C \subseteq A$ , we have  $f(\sqcup C)=\sqcup\{f(c)\mid c\in C\}.$  Analogously, one can define  $\sqcap$ -continuous functions.

An element  $a \in A$  is a fixpoint of a function  $f : A \longrightarrow A$  iff  $f(a) = a$ .

❖ An example: Consider the function  $f : \mathbb{N}_{\infty} \longrightarrow \mathbb{N}_{\infty}$  defined such that  $\forall n \in \mathbb{N}$ .  $f(n) = 0$ and  $f(\infty)=\infty$ .

- f is monotonic since (1)  $\forall n_1, n_2 \in \mathbb{N}$ .  $f(n_1) = 0 \leq 0 = f(n_2)$  and (2)  $\forall n \in \mathbb{N}$ .  $f(n) = 0 \leq \infty = f(\infty)$ .
- f is not  $\sqcup$ -continuous since  $\mathbb N$  is a chain and  $f(\sqcup \mathbb N)=f(\infty)=\infty$ , but  $\Box\{f(n) \mid n \in \mathbb{N}\} = \Box\{0\} = 0.$
- $\bullet$ 0 is the least fixpoint of  $f$  and  $\infty$  is the greatest fixpoint of  $f$ .

**Exter Tarski Theorem.** Let  $(A, \leq_A)$  be a complete lattice and let  $f : A \longrightarrow A$  be a monotonic function. Then the set of fixpoints of  $f$  in  $(A,\leq_A)$  is also a complete lattice.

❖ Since complete lattices have the least and the greatest element, the theorem in particular guarantees the existence of a least and greatest fixpoint of  $f$  in  $A.$ 

**Exter Tarski Theorem.** Let  $(A, \leq_A)$  be a complete lattice and let  $f : A \longrightarrow A$  be a monotonic function. Then the set of fixpoints of  $f$  in  $(A,\leq_A)$  is also a complete lattice.

❖ Since complete lattices have the least and the greatest element, the theorem in particular guarantees the existence of a least and greatest fixpoint of  $f$  in  $A.$ 

#### *For the more curious:*

 $\clubsuit$  In more constructive terms, the least fixpoint of f is the stationary limit of  $f^{\alpha}(\perp_A)$  for  $\alpha$ ranging over the ordinals.

• An ordinal is the order type of a well-ordered set.

**Exter Tarski Theorem.** Let  $(A, \leq_A)$  be a complete lattice and let  $f : A \longrightarrow A$  be a monotonic function. Then the set of fixpoints of  $f$  in  $(A,\leq_A)$  is also a complete lattice.

#### *For the more curious:*

 $\clubsuit$  In more constructive terms, the least fixpoint of f is the stationary limit of  $f^{\alpha}(\perp_A)$  for  $\alpha$ ranging over the ordinals.

- An ordinal is the order type of a well-ordered set.
- Every ordinal can be represented as the set of all smaller ordinals. There is the zero ordinal, successor ordinals, and limit ordinals. Natural numbers correspond to the so called finite ordinals (ordering types of finite sets), the set of natural numbers is the first infinite ordinal, and so on.

**Exter Tarski Theorem.** Let  $(A, \leq_A)$  be a complete lattice and let  $f : A \longrightarrow A$  be a monotonic function. Then the set of fixpoints of  $f$  in  $(A,\leq_A)$  is also a complete lattice.

- ❖ A dual result holds for the greatest fixpoint.

- **Expoint Theorem.** Let  $(A, \leq_A)$  be a complete lattice and  $f : A \longrightarrow A$  a function.
	- If f is  $\sqcup$ -continuous, the least fixpoint of f is  $\mu f = \sqcup \{f^i(\perp_A) \mid i \geq 0\}.$

- If f is  $\sqcup$ -continuous, the least fixpoint of f is  $\mu f = \sqcup \{f^i(\perp_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊔</sup>-continuous function is monotone, and hence one in fact computes the supremum of the ascending chain  $\perp_A \leq_A f(\perp_A) \leq_A f(f(\perp_A)) \leq ...$

- If f is  $\sqcup$ -continuous, the least fixpoint of f is  $\mu f = \sqcup \{f^i(\perp_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊔</sup>-continuous function is monotone, and hence one in fact computes the supremum of the ascending chain  $\perp_A \leq_A f(\perp_A) \leq_A f(f(\perp_A)) \leq ...$
- If f is  $\sqcap$ -continuous, the greatest fixpoint of f is  $\nu f = \sqcap \{f^i(\top_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊓</sup>-continuous function is monotone, and hence one in fact computes the infimum of the descending chain  $\top_A \geq_A f(\top_A) \geq_A f(f(\top_A)) \geq \dots$

- If f is  $\sqcup$ -continuous, the least fixpoint of f is  $\mu f = \sqcup \{f^i(\perp_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊔</sup>-continuous function is monotone, and hence one in fact computes the supremum of the ascending chain  $\perp_A \leq_A f(\perp_A) \leq_A f(f(\perp_A)) \leq ...$
- If f is  $\sqcap$ -continuous, the greatest fixpoint of f is  $\nu f = \sqcap \{f^i(\top_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊓</sup>-continuous function is monotone, and hence one in fact computes the infimum of the descending chain  $\top_A \geq_A f(\top_A) \geq_A f(f(\top_A)) \geq \dots$
- ❖ **Theorem.** For finite complete lattices, every monotonic function is ⊓- and ⊔-continuous.

- If f is  $\sqcup$ -continuous, the least fixpoint of f is  $\mu f = \sqcup \{f^i(\perp_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊔</sup>-continuous function is monotone, and hence one in fact computes the supremum of the ascending chain  $\perp_A \leq_A f(\perp_A) \leq_A f(f(\perp_A)) \leq ...$
- If f is  $\sqcap$ -continuous, the greatest fixpoint of f is  $\nu f = \sqcap \{f^i(\top_A) \mid i \geq 0\}.$ 
	- Moreover, <sup>a</sup> <sup>⊓</sup>-continuous function is monotone, and hence one in fact computes the infimum of the descending chain  $\top_A \geq_A f(\top_A) \geq_A f(f(\top_A)) \geq \dots$
- ❖ **Theorem.** For finite complete lattices, every monotonic function is ⊓- and ⊔-continuous.
- ❖ **Corollary.** On finite lattices, the Kleene fixpoint theorem is applicable, hence,
	- to compute the least fixpoint, start with  $\perp_A$  and iteratively apply f till  $f^i(\bot_A) = f^{i+1}(\bot_A) = \mu f,$
	- to compute the greatest fixpoint, start with  $\top_A$  and iteratively apply f till  $f^i(\top_A) = f^{i+1}(\top_A) = \nu f.$
